Setup	3

Introduction

Rollout Mysql requires a database server in order to work, the setup process does not install any database management system but a script prepares the database tables to be used by the application.

You must provide a database server and an empty database either MySQL or MariaDB and you must know the following information for the installation process:

- IP or Hostname of the database server which could/should be remote.
- The port on which the database server is communicating. Default port for MySQL is 3306. Default port for MariaDB is 3307.
- A database super user with its password. It could be root for the setup but remote access for root to the database must be prepared, check your database documentation. If the user is not root, make sure it has super powers to create a database, tables, triggers and procedures.
- A database name for the application.
- A normal database user with permissions limited to run the application schema such as select, insert, update, delete with remote access granted.

Setup

The setup is pretty straight forward, a wizard will guide you through the steps of installation.

Run the program «Rollout-MySQL_Install.exe» and follow the instructions. Enter the serial key you received by email during the purchase process when requested.

The program must be installed in «C:\ProgramData». There is no guarantee the program would work if installed in a different location due to internal constraints.

At some point, the Database installation process will open an MS-DOS window where you will be asked to input the Database information: IP or hostname, database port, user/password and schema name. You will then be asked if you are using a MySQL or a MariaDB database, select accordingly. MariaDB might be a fork of MySQL, they do have differences in their engine, hence the different scripts to be run.

In case of error during the installation process, please review the notepad log («Installation_output.log») which will be shown automatically.

If you are unable to solve your installation problem, please contact the author: contact@chalkeia.com with the most details possible, including the «Installation_output.log».
